

# Python Programming - Practice 3-

Marie Beurton-Aimar

## List

### Exercise 1 Management of experiments

- Ask to the user how many experiments he wants to manage.
- Ask for each the `id` and store them in a list.
- Ask for each `id` the number of trials he does and store in another list.
- Display to the screen for each `id` the number of trials associated.
- Search the name of the trial which has the maximum of trials.
- Search the average value of trials number.
- Display the `id` of the trials which exhibits more trials than the average value.
